Abstract

Gravity is widely accepted to be responsible for falling, orbits, and several minor inconveniences. However, its true nature remains unclear. In this paper we review the leading theories of gravity, including force, spacetime curvature, acceleration, entropy, geometry, and ice cream. We present new experimental results based on dropping various office supplies and conclude that gravity is almost certainly doing something, although further work is required to determine what.

1. Introduction

Gravity has been studied for several hundred years, primarily by dropping things and writing down what happened. Despite this, the scientific community remains divided on what gravity actually is. Some believe it is a force, others believe it is curved spacetime, and a small but growing group believe it is a funding strategy.

The purpose of this paper is to finally determine what gravity is, or at the very least produce a document that looks like we tried.

2. Gravity as Acceleration

It has been established that gravity is acceleration.

This is an extremely important discovery and explains a great deal. However, this is also everything we know about that, so we will move on.

3. Current Theories of Gravity

3.1 Gravity as a Force

First proposed by a man sitting under a tree who was attacked by fruit, gravity was described as a force that attracts objects to each other. This theory worked extremely well until people started asking more complicated questions.

3.2 Gravity as Curved Spacetime

Einstein later proposed that gravity is not a force but the result of spacetime being curved. This raised further questions, such as:

- What is spacetime made of?
- What is it curved into?
- Is it possible it is just slightly bent and nobody noticed?

3.3 Gravity as a Wave

More recently, gravity has been detected as waves. This suggests gravity may be a ripple. If this is the case, we are currently experiencing the middle of a ripple, which raises the important question: where is the end of the wave? We propose it may be slightly to the left.

3.4 Gravity as Geometry

At this point, most physicists agree gravity is probably geometry. Unfortunately, nobody is entirely sure what this means, but it involves tensors, which are very serious.

4. Gravity and Entropy

Some scientists believe gravity is related to entropy, which is always increasing. This would explain why everything becomes more messy over time and why drawers that were tidy in 2014 are no longer tidy now.

It may also explain black holes. Black holes are said to have infinite density, which is a very large amount of density and therefore probably requires a lot of entropy. This is consistent with the fact that entropy is always increasing and black holes are widely known to be extremely serious.

We attempted to test this theory by increasing the entropy in the office kitchen, but this did not produce a black hole, only a meeting.

5. Black Holes and Spaghettification

In order to better understand gravity, it was proposed that a member of staff be lowered into a black hole to see what happens. Alison from HR was nominated due to her strong email presence, but she declined on health and safety grounds and also because she said "absolutely not."

This is unfortunate as it would have answered several questions and potentially cancelled the Tuesday team-building exercises.

6. The Personality of Gravity

What we can say with 100% scientific certainty is that gravity can one day be your friend and the next your worst enemy. For example:

- It keeps you on the ground.
- It also makes you fall off ladders.

This suggests gravity may hold grudges or at the very least has a complicated relationship with humans.

Because revenge is a dish best served cold, we cannot rule out the possibility that gravity is, in fact, ice cream. Further research is required into which flavour.

7. Experimental Results

We performed a series of high-precision experiments:

Object Dropped	Result
Pen	Fell
Mug	Fell
Important document	Fell
Morale	Fell

All results were statistically significant.

8. Discussion

At this stage, gravity appears to be:

- A force
- Acceleration
- Curved spacetime
- Entropy
- Geometry
- Possibly ice cream
- Or some combination of the above

This places gravity in the category of "complicated."

9. Field Research: The Ice Cream Man

In order to investigate the previously proposed hypothesis that gravity may in fact be ice cream, we conducted field research with a local ice cream vendor.

When asked about gravity, the ice cream man stated that a 99 with a flake now costs £7.99 and does not include a flake. This represents a significant increase compared to previous years and also a significant decrease in flake.

This observation is of great scientific importance because it demonstrates three key phenomena:

Phenomenon	Behaviour
Gravity	Pulls things down
Entropy	Always increases
Price of a 99	Always increases

Furthermore, the amount of flake appears to be decreasing, which suggests the existence of an additional physical law known as Flake Conservation Failure.

This leads to the following unified theory:

As entropy increases, flakes decrease, prices increase, and gravity continues to behave however it wants.

This is the first time these three quantities have been linked in a single theoretical framework and represents a major breakthrough in dessert-based physics.

10. Economic Model of Gravity

We propose that gravity may operate on a supply and demand basis. There is a high demand for "down," and gravity continues to supply it.

Attempts to supply "up" have been largely unsuccessful except in balloons, rockets, and very small dogs that jump too high.

11. Proposed Grand Unified Theory

We therefore propose the following possibilities for what gravity actually is:

1. A force
2. Acceleration
3. Curved spacetime
4. Entropy
5. Geometry
6. Ice cream
7. The price of a 99
8. A management strategy
9. Something to do with magnets
- (unlikely but worth mentioning)
10. Bigfoot

At this stage, Bigfoot explains almost as many things as quantum gravity, and significantly more than our current budget.

SUSPECTS IN THE GRAND UNIFIED CASE

13. Conclusion

In conclusion, gravity is definitely present and continues to operate in a downward direction with malicious consistency. However, until the price of a 99 stops increasing and flakes are restored to their natural levels, we cannot rule out the possibility that gravity, entropy, and ice cream are all part of the same system.

This system is complicated and may be run by someone else.

14. Acknowledgements

The authors would like to thank:

- Dave from Accounts for confirming gravity is “still on.”
- Alison from HR for refusing to be spaghetti-fied.
- The office chair for remaining on the floor throughout the study.
- Gravity, for making this research possible.

Appendix B – Peer Review Comments

Reviewer 1: “This paper does not answer any questions.”

Authors: “We agree and believe this is an important contribution to the field.”

Reviewer 2: “Your sample size appears to be one pen.”

Authors: “We dropped it several times.”

Reviewer 3: “You cannot seriously propose that gravity is ice cream.”

Authors: “We cannot rule it out.”
