

The Unambiguous Correlation Between Horses Missing Horns and Galaxies Missing Mass

Abstract

We present a comparative meta-analysis of two enduring astrophysical mysteries: the persistent absence of dark matter and the persistent absence of unicorns.

Both phenomena are invoked to explain observational gaps — in one case, the unexpectedly high rotational velocities of galaxies; in the other, the persistent under-enchancement of modern zoology.

We find that, across multiple datastes and narratives, the evidential foundations of dark matter and unicorns exhibit a statistically indistinguishable degree of empirical support.

Applying the Motion-Timespace (MTS) framework, we further demonstrate that both anomalies may be resolved through a unified principle of emergent motion, thereby restoring elegance to both cosmology and mythology.

1. Introduction

REVIEWED BY:
PROF. S. SIRIUS

★ ★ ★

For nearly a century, astronomers have posited the existence of dark matter — an invisible substance allegedly constituting $\approx 85\%$ of the universe's mass (Einasto & Kaaret 1933; Zwicky 1937).

Despite extensive searches, no direct detection has been achieved.

Meanwhile, for an equivalent period, literature has maintained the plausible existence of unicorns (e.g. Rowling 1997; Hasbro 1983), also without empirical verification.

In both cases, their respective communities insist the universe would be incomplete without them.

It is thus timely to examine whether the evidential asymmetry between astrophysics and mythology is genuine, or merely semantic.

EVIDENCE LOG

ABSENCE NOTED. CONFIDENCE UNAFFECTED.

COMPARISON CHART: GALAXY vs. UNICORN

GALAXY		UNICORN
Stars, gas, dust, light	VISIBLE STUFF	Mane, hooves, very nice
Observed ~15%	MASS/PRESENCE	Observed ~15% (on a good day)
Dark matter ~85%	UNSEEN COMPONENT	Unicorniness ~85%
Gravitational effects	DETECTION METHOD	Hoofprints, glitter, third eye
Lensing, rotation curves, CMB	BEST EVIDENCE	Sparkle trails, eyewitness poetry
If you can't see it, it's probably what holds it together.	COMMON REMARK	If you can't see it, it's probably magical.

DIFFERENT CREATURES. SAME STORY.

OBSERVATIONAL INSTRUMENT

RANCH SCOPE
MODEL: CDS-42R

- ADJUSTS FOR EXPECTATIONS

CLUE COLLECTION

HOOVPRINTS (EQUINE)

RECOVERED: PINE NEEDLE MEADOW
DATE: ???-??-??
ANALYST: H. LOCK

GLITTER TRAILS (UNICORN)

RECOVERED: MOONLIT RIDGE
DATE: ???-??-??
ANALYST: H. LOCK

2. Observational Evidence

Phenomenon	Predicted Signature	Direct Detections	Indirect Inference	Public Enthusiasm Index
Dark Matter	gravitational lensing, velocity dispersion	0	High (model-dependent)	7/10
Unicorns	hoofprints, glitter trails	0	High (plot-dependent)	9/10

- ★ In both datasets, non-detection has not decreased confidence.
- ★ Rather, absence is reinterpreted as proof of subtlety.
- U This Bayesian inversion — the rarer it is, the more real it must be — forms the foundation of what we term the Invisibility Equivalence Principle (IEP).

3. Funding Dynamics

- ★ The dark-matter sector commands global research investment exceeding \$10 billion (ESA 2024).
- ★ In comparison, unicorn studies receive indirect cultural funding exceeding \$30 billion via publishing, cinema, and associated toy economies.
- ★ Both exhibit the same correlation between budget magnitude and observational null results — a relationship we call the Non-Detection Investment Paradox (NDIP).
- ★ Mathematically,
where F = funding and N = number of detections (≈ 0).
- ★ Thus $F \propto 1/N$: the fewer detections, the greater the funding.
- ★ This negative feedback stability may explain the longevity of both research programmes.

$$\frac{dF}{dN} = -k$$

THE MORE YOU FUND, THE LESS YOU FIND.

The Unambiguous Correlation Between Horses Missing Horns and Galaxies Missing Mass

Dark-matter proponents argue that, without their invisible component, galactic rotation curves cannot be fitted.

Fantasy authors argue that, without unicorns, narrative magic cannot be sustained.

Both claims rely on model-dependent indispensability: remove the assumption and the system collapses under its own logic.

We therefore posit a Conservation of Wonder law:

EVIDENCE CHAIN: CONNECTING THE ABSURD (BUT PROBABLE)

When empirical data lack mystery,
IMAGINATION SUPPLIES MASS.

The Unambiguous Correlation Between Horses Missing Horns and Galaxies Missing Mass

5. Discussion

The parallel is striking.

Both constructs emerged to preserve elegance — one in physics, the other in storytelling.

Both have resisted falsification via successive re-definitions:

- Dark matter evolved from 'massive invisible stars' to 'weakly interacting particles' to 'whatever fits the data.'
- Unicorns evolved from 'horses with horns' to 'metaphors for purity' to 'whatever fits the merch.'

Within the Motion-Timespace (MTS) framework, gravitational curvature and narrative curvature share a mathematical symmetry: both distribute motion unevenly to maintain coherence.

Hence, galaxies missing mass and horses missing horns may represent the same underlying tendency of complex systems — to conceal beauty behind assumed absence.

The Unambiguous Correlation Between Horses Missing Horns and Galaxies Missing Mass

★ ## 6. Conclusions ★

We conclude that:

1. The evidential basis for dark matter and unicorns is observationally equivalent.
2. Both owe their persistence to model-dependent necessity and the NDIP effect.
3. Replacing dark matter with motion-based curvature dynamics (MTS) provides a natural explanation without mythical particles.
4. Replacing unicorns with horses still leaves the forests under-enchanted.

Therefore, the simplest reconciliation is that both dark matter and unicorns exist — not as particles or animals, but as curvature artefacts of human imagination seeking equilibrium between motion and meaning.
