White Paper Series No. 47-B: On the Performative Rejection of Artificial Intelligence Within Digitally Amplified Ecosystems

EXECUTIVE SUMMARY

The Institute for Strategic Irony Decommissioning (ISID) hereby submits this formal assessment of the escalating phenomenon known as Digitally Mediated AI Fatigue Declaration (DMAIFD)—a condition characterized by public denunciations of artificial intelligence disseminated via algorithmically optimized social platforms.

The specimen under review is a publicly circulated declaration asserting the desire to cease discussion of artificial intelligence while simultaneously invoking, enumerating, and amplifying the competitive taxonomy of said artificial intelligences. This paradoxical expression was distributed through a high-engagement social network infrastructure and subsequently accrued measurable algorithmic amplification metrics (21K impressions; multi-tier interaction footprint).

The Institute finds, with calibrated solemnity, that the declaration does not reduce AI discourse. Rather, it constitutes a Second-Order Amplification Event (SOAE)—a self-propelling rhetorical device in which opposition to technological saturation functions as a primary driver of further technological saturation.

The urgency of this inquiry is severe. If unmanaged, DMAIFD threatens to create a feedback loop in which:

1. Complaints about AI generate engagement.
2. Engagement strengthens AI-driven recommendation systems.
3. Strengthened systems surface more AI discourse.
4. Additional complaints emerge.

This cycle has been provisionally classified as the Recursive Exhaustion Spiral (RES-∞).

Immediate institutional intervention is therefore warranted.

White Paper Series No. 47-B: On the Performative Rejection of Artificial Intelligence Within Digitally Amplified Ecosystems

1. CONTEXTUAL FRAMEWORK

1.1 Definition of the Problem

The declarative structure “I do not want to hear about AI” when posted to an AI-amplified feed constitutes a performative contradiction categorized under the ISID taxonomy as:

Oppositional Participatory Amplification (OPA-3)

OPA-3 events are distinguished by three features:

- Explicit rejection of a subject.
- Explicit listing of subcomponents of the rejected subject.
- Deployment within the distribution mechanism that privileges the rejected subject.

All three criteria are satisfied.

1.2 Platform Paradox

The statement was disseminated via a social media entity whose content visibility is governed by machine-learning ranking systems. The post achieved:

- Measurable impressions.
- Engagement vectors (likes, replies, reposts).
- Algorithmic reinforcement.

The declared desire to “exist like a normal human being for five consecutive minutes” was executed within a digital interface optimized for interruption frequency intervals of approximately 2.4 seconds.

The Institute notes the following paradoxical alignment:

Stated Desire	Actual Mechanism Used
Silence about AI	Public post about AI
Escape from screens	Mobile interface publication
Relief from hype	Engagement-optimized rhetoric

This alignment is designated Structural Irony Convergence (SIC-5).

2. IRONY DECONSTRUCTION METHODOLOGY

The Institute deployed the following proprietary frameworks:

2.1 Rhetorical Inversion Mapping (RIM™)

A structured mapping of stated intention versus behavioral outcome. Finding: Each negation (“I don’t want...”) increases semantic density around the prohibited subject, reinforcing cognitive salience.

2.2 Benchmark Denial Index (BDI)

The text rejects benchmarks, demos, model comparisons, and hype narratives. However, it enumerates model names in sequence. Enumeration statistically increases:

- Searchability
- Discoverability
- Associative indexing

Thus, benchmark denial produces meta-benchmarking awareness.

2.3 The Chai Displacement Hypothesis (CDH)

The closing aspiration—tea consumption and non-digital presence—serves as a symbolic analog for pre-accelerationist temporality. However, the invocation of analog stillness inside a high-velocity digital environment produces contrast-driven virality. The pastoral fantasy becomes an aesthetic performance object.

Result: the longing for quiet becomes content.

3. STRUCTURAL IRONY ANALYSIS

3.1 Enumeration as Amplification

The post rejects competitive model discourse while naming multiple AI systems in comparative structure ("X beat Y or Z beat W").

This rhetorical listing functions as:

- An index.
- A topical cluster.
- A search keyword payload.

Thus, the rejection performs unpaid marketing for the rejected entities.

We classify this phenomenon as:

Involuntary Promotional Exhaustion (IPE-2)

3.2 Anti-Hype as Hype

The assertion "this changes everything" is criticized as hyperbolic discourse. Yet the counter-position—"Enough"—is itself maximalist. Binary absolutism remains intact. The emotional register mirrors the urgency of the hype it condemns.

Therefore, anti-hype operates as negative hype.

This yields a net-neutral outrage balance but positive engagement yield.

3.3 Platform Dependency Variable

The longing for five consecutive minutes of normal human existence is expressed in a medium structurally incapable of enabling five uninterrupted minutes of disengagement.

The Institute observes that:

- The platform incentivizes reaction.
- Reaction generates metrics.
- Metrics justify algorithmic prioritization.
- Prioritization elevates AI discourse.

Conclusion: The complaint is functionally indistinguishable from participation.

4. PERSONNEL ASSIGNED TO THE ANALYSIS

-  **Dr. Percival Thorne, PhD** (Meta-Recursive Systems)
Lead Investigator, Department of Algorithmic Irony Collapse
Specialization: Feedback loops that deny their own existence.
-  **Prof. Leela Banerjee, DPhil** (Applied Exhaustion Studies)
Director, Human Attention Attrition Lab
Authored seminal paper: "Fatigue as Fuel: Monetizing the Desire to Log Off."
-  **Senior Analyst Unit 7-B** (Autonomous Sentiment Engine)
Certification: ISO-9001 Compliant Emotional Pattern Recognition
Primary task: Quantification of Chai-Adjacent Longing.
-  **Adjunct Fellow (Visiting)**, Chair of Analog Nostalgia Metrics
Credentialed in Pre-Digital Stillness Reconstruction (PDSR Level IV).

5. BUDGETARY ALLOCATION

Project Code: IRN-404-NO-MORE-AI

Line Item Description	Allocation (USD)
Personnel 4.75 FTE (including one semi-sentient dashboard)	\$1,240,000
Sentiment Analytics Platform Subscription to Recursive Irony Tracker™	\$380,000
Analog Simulation Chamber Recreated "Five-Minute Normal Human Being" Lab	\$610,000
Chai Procurement & Control Beverages Organic, algorithmically neutral	\$72,500
Platform Engagement Replication Sandbox AI-driven virality emulator	\$940,000
Emergency Irony Containment Fund For spontaneous backlash events	\$500,000
Total	\$3,742,500

Projected Return on Insight (ROI²):
Incalculable but confidently positive.

6. RISK ASSESSMENT

Failure to address DMAIFD may result in:

- Escalation of AI fatigue posts.
- Increased engagement metrics.
- Greater AI content prioritization.
- Broader cultural declarations of exhaustion.
- Institutionalization of exhaustion as identity.

Conversely, successful mitigation may eliminate public irony, destabilizing the digital economy.

The Institute therefore recommends Measured Continuation of Paradox.

7. CONCLUSION

After exhaustive review, ISID concludes that the post successfully rejects artificial intelligence discourse while simultaneously expanding it. It denounces hype through a viral-ready rhetorical structure. It longs for silence within a machine designed for amplification.

The irony is not incidental. It is infrastructural.

Accordingly, we affirm that:

- The declaration is a protest.
- The protest is content.
- The content is optimized.
- The optimization sustains the system protested.

In closing, the Institute formally recommends that all future calls for digital quiet be filed through the Department of Algorithmic Dissemination to ensure maximum visibility.

Respectfully submitted,
The Institute for Strategic Irony Decommissioning (ISID)
